Let's Start!

How much do you know about CASE?

Learning Outcome:

Identify key information about people's jobs and places of work in spoken or written contexts.
Make the information system design report, based on the selection of both hardware and software tools required for the IT solution.

Can Do Statements:

- I can explain what CASE is.
- I can compare CASE to computer aided design, CAD.
- I can discuss about the risks factors related to CASE.

Ask your partner:

- What design software programs do you know?
- Have you ever had any problems when designing software?

Let's Explore!

Innovative software programs!

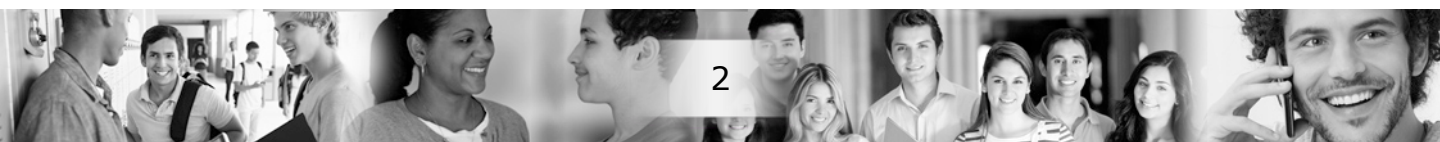

Instructions: Read the text below.

A particular phenomenon of technology is the rapidly and constant advance in any of its domains. A concrete example that illustrates this argument is the software tool CASE. This acronym obeys to the name of Computer Aided Software Engineering. CASE is an operating system software to design applications in a productive way, reducing costs and time. It works with two types of tools: The Upper CASE tools, specialized in business maintenance, access to data and data transferring, as flow diagrams and decision tables. And, the second ones, the Lower CASE tools, which are as important as the first ones, but are specialized in operational activities like design and debugging.

Now then, as any software application, CASE faces some risks, such as: First, lack of training; a CASE programmer needs time to practice and explore in depth the software features. Second, lack of accuracy in the software execution. If the programmer doesn't know how to run the program and take advantage of the innovative capabilities that CASE offers, it couldn't be useful at all. Third, standardization difficulties. Depending on the company's requirements, engineers have to adapt CASE to each new methodology. And, fourth, improbable expectations, when marketing strategies extol the software qualities.

On the other hand, there are other software tools as the Computer Aided Design, or CAD, whose main functions are to create, modify and optimize designs. So, this one is as essential as CASE in any process that implies creation tools. This design software is quite used for the building, automotive and aerospace industries. It results as useful as CASE to improve the productivity and the quality in any particular task. And related to its applicability, with the appropriate training, it can be as easy to use as CASE.

Let's Practice!

Do you know the risks of CASE?

Instructions: Read the statements. Circle all the correct answers.

1. Some risks of CASE are:
 - a. lack of inventive capabilities.
 - b. lack of accuracy in the operation of the software.
 - c. lack of training.
2. When you have standardization difficulties is because:
 - a. the company requires a lot.
 - b. engineers have to adapt CASE to new methodologies.
 - c. the programmer doesn't take advantage of all the tools CASE offers.
3. Improbable expectations are when:
 - a. the marketing company oversells the capabilities of CASE.
 - b. the company exaggerates the characteristics of CASE.
 - c. the organization requires many tools.

Let's Practice!

Do you know anything about CASE?

Instructions: Complete the sentences by writing its corresponding word. Use capital letter where necessary. Use: are not as relevant as, as important as, difference is.

1. In CASE, the Lower tools are _____ the Upper tools.
2. The _____ that for Upper Case tools, operational activities _____ for Lower Case tools.

Extension Activity

Let's learn more about CASE.

Instructions: Complete the following steps. Fill in the Self-Assessment.

- Look for a software designed with CASE.
- List the tools that you identify were used in the creation.
- Compare with the tools you learned in this learning material.
- Write a short paragraph with the comparisons.
- Share it with your classmates.

Self-Assessment

Yes

No

- I list the tools I recognize in a software. ☐ ☐
- I compare those tools with the ones I learned in this learning material. ☐ ☐
- I write a short paragraph with the vocabulary and structures I learned in this learning material. ☐ ☐

Target Words

- accuracy** (noun): precision
e.g. Lack of accuracy in the software execution. If the programmer doesn't know how to run the program and take advantage of the innovative capabilities that CASE offers, it couldn't be useful at all.
- standardization** (noun): the normalization or uniformity in something
e.g. Third, standardization difficulties. Depending on the company's requirements, engineers have to adapt CASE to each new methodology.
- debugging** (noun): the process of isolating and fixing errors in a computer program
e.g. The Lower CASE tools, which are as important as the first ones, but are specialized in operational activities like design and debugging.
- computer aided** (adjective): the utility of the computer to develop certain activities in an easier and more functional way
e.g. This acronym obeys to the name of Computer Aided Software Engineering.
- decision table** (noun): a diagram to scale the different conditions of a problem
e.g. The Upper CASE tools, specialized in business maintenance, access to data and data transferring, as flow diagrams and decision tables.
- extol** (verb): to publicize something as the best option to choose
e.g. And, fourth, improbable expectations, when marketing strategies extol the software qualities.

Learning Points

Comparatives Using as... as.

You can use **as ... as** to compare things when the things we are comparing are the same in a certain way.

To make a comparative statement with "as" you follow this structure:

Subject + Verb + **As** + Adjective + **As** + Complement

Examples:

- *This new software program is **as complex as** its previous version.*
- *The software tools of this application **are as convenient as** the ones of that other application.*

Notice that when you compare with *as ... as* the adjective remains the same.

On the other hand, you can conclude that two things are different by comparing with *as ... as* in the negative form.

Structure:

S + Verb + **Not** + **As** + Adjective + **As** + Complement

Examples:

- *This new software program is **not as complex as** its previous version.*
- *The software tools of this application **are not as convenient as** the ones of that other application.*

Notice that in this kind of comparisons the first named thing has an inferior connotation than the second one.

Examples

- *And, the second ones, the Lower CASE tools, which are as important as the first ones.*
- *This one is as essential as CASE in any process that implies creation tools.*
- *It results as useful as CASE to improve the productivity and the quality in any particular task.*

Learning Points

Collocations with Different Verbs Related to Computers.

A **collocation** is a word that fits correctly with other word. And, both together make a natural and proper sense.

Collocations in Technology field are very common.

In the chart below, you can check some common verb collocations related to computers:

COMPUTERS COLLOCATIONS	
VERB	WORDS
Access	Access information, access data
Boot up / Start up	Boot up / start up the computer
Check	Check e-mail
Delete	Delete a file, delete a program, delete a picture
Log on / Log off	Log on/ log off (to) the internet, log on/ log off (to) the computer, log on/ log off (to) the administrator account
Reboot	Reboot the computer, reboot the device
Receive	Receive an e-mail, receive a notification, receive data
Restart	Restart the computer, restart the device, restart the server
Run	Run a program
Switch on / Switch off	Switch on/switch off the computer

Examples

- *The Upper CASE tools, specialized in business maintenance, access to data and data transferring, as flow diagrams and decision tables.*
- *If the programmer doesn't know how to run the program and take advantage of the innovative capabilities that CASE offers, it couldn't be useful at all.*
